**AXA/ClearBridge Large Cap Growth Portfolio**

### Investment Objective & Strategy

The investment seeks to achieve long-term capital growth. Under normal circumstances, the portfolio invests at least 80% of its net assets, plus borrowings for investment purposes, if any, in equity securities or other instruments with similar economic characteristics of U.S. companies with large market capitalizations. It may invest up to 20% of its assets in equity securities of companies other than those with market capitalizations similar to companies in the index (i.e., medium or small capitalization companies). The portfolio also may invest up to 10% of its net assets in foreign securities, either directly or through depositary receipts.

See the Disclosure pages in the back of this document for important information on the Morningstar Rating and specific investment risks.
Disclosure

When used as supplemental sales literature, the Investment Profile for this portfolio must be preceded or accompanied by the appropriate variable annuity or variable life current prospectus, as well as these disclosure pages. Portfolio statistics and rankings are subject to change and have not been adjusted for insurance-related charges and expenses associated with the life insurance policies or variable annuity contracts. Certain products may offer portfolio share classes that are different than those reported in this Investment Profile and could have ratings that are higher or lower than those shown.

AXA Equitable contracts Morningstar Inc., for a fee, as a third-party advisor to produce this Investment Profile. In this capacity, Morningstar independently provides analysis on the underlying investment options for AXA Equitable. AXA Equitable and its affiliates have not independently verified this information.

Portfolios that feature AXA Equitable's proprietary managed-volatility strategy (or may invest in underlying portfolios that feature this strategy) utilize futures and options to manage equity exposure when market volatility increases above specified thresholds set for the portfolio. It is not possible to manage volatility fully or perfectly, which could cause these portfolios to underperform or experience losses.

Morningstar Rating™

Often simply called the Star Rating, the Morningstar Rating brings performance (returns) and risk together into one evaluation. To determine a portfolio's star rating for a given time period (three, five, or 10 years), the portfolio's risk-adjusted return is plotted on a bell curve. If the portfolio scores in the top 10% of its category, it receives 5 stars (Highest); if it falls in the next 22.5% it receives 4 stars (Above Average); the middle 35% Average; the next 22.5% Below Average, and the bottom 10% Low. Morningstar Return is measured for up to three time periods (three-, five-, and 10-years). These separate measures are then weighted and averaged to produce an overall measure for the portfolio. Portfolios with less than three years of performance history are not rated.

Morningstar Risk

This statistic evaluates the variations in a portfolio's monthly returns, with an emphasis on downside variations. In each Morningstar Category, the 10% of portfolios with the lowest measured risk are described as Low Risk, the next 22.5% Below Average, the middle 35% Average, the next 22.5% Above Average, and the top 10% High. Morningstar Risk is measured for up to three time periods (three-, five-, and 10-years). These separate measures are then weighted and averaged to produce an overall measure for the portfolio. Portfolios with less than three years of performance history are not rated.

Risk Measures and Statistics

Morningstar chooses the applicable benchmark for computing the risk measures and statistics. This index may differ from the benchmark index or the indices in the underlying prospectus. The index is an unmanaged portfolio of specified securities and does not reflect any expenses. It is not possible to invest directly in an index.

Standard Deviation: Standard deviation is a statistical measure of the volatility of the portfolio's returns.

Beta: Beta is a measure of a portfolio's sensitivity to market movements. A portfolio with a beta greater than 1 is more volatile than the market, and a portfolio with a beta less than 1 is less volatile than the market.

Sharpe Ratio: Sharpe ratio uses standard deviation and excess return to determine reward per unit of risk.

Alpha: Alpha measures the difference between a portfolio's actual returns and its expected performance, given its level of risk (as measured by beta).

R-squared: R-squared reflects the percentage of a portfolio's movements that are explained by movements in its benchmark index, showing the degree of correlation between the portfolio and the benchmark.

Income Ratio: Income ratio reveals the percentage of current income earned per share. The income ratio can be used as a gauge of how much of the total return comes from income.

Information Ratio: Information Ratio is a risk-adjusted performance measure. The information ratio is a special version of the Sharpe Ratio in that the benchmark doesn't have to be the risk-free rate.

Price/Earnings (P/E) Ratio: Price/Earnings Ratio is a stock's current price divided by the company's trailing 12-month earnings per share.

Price/Book (P/B) Ratio: Price/Book Ratio is the weighted average of the price/book ratios of all the stocks in a portfolio.

Price/Cash (P/C) Ratio: Price/Cash Ratio represents the weighted average of the price/cash flow ratios of the stocks in a portfolio.

Geometric Average Cap (GeoAvgCap): Geometric Average Cap is the geometric mean of the market capitalization for all of the stocks the portfolio owned.

Volatility Analysis

Morningstar Volatility Rank is an investment’s 3-year standard deviation overall percentile rank within its US open-end, variable annuity/life variable fund, or variable annuity/life subaccount universe. The investment with the lowest standard deviation receives a rank of 1. We then classify investment portfolios as having one of three volatility levels relative to all types of mutual funds: Low, Moderate, and High. Investments with wider ranges of returns are labeled “high”, as they are considered riskier than “low” volatility investments, which have had smaller ranges of returns. We also show where the portfolio's category lands. For portfolios that haven’t been in existence for three years, we simply show the category average.

Morningstar Style Box™

The Morningstar Style Box reveals a fund’s investment style as of the date noted on this report. For equity funds the vertical axis shows the market capitalization of the long stocks owned and the horizontal axis shows investment style (value, blend, or growth). For fixed-income funds, the vertical axis shows the credit quality of the long bonds owned and the horizontal axis shows interest rate sensitivity as measured by a bond’s effective duration.

Morningstar seeks credit rating information from fund companies on a periodic basis (e.g., quarterly). In compiling credit rating information Morningstar accepts credit ratings reported by fund companies that have been issued by all Nationally Recognized Statistical Rating Organizations (NRSROs). For a list of all NRSROs, please visit http://www.sec.gov/divisions/marketreg/ratingagency.htm. Additionally, Morningstar accepts foreign credit ratings from widely recognized or registered rating agencies. If two rating organizations/agencies have rated a security, fund companies are to report the lower rating, if three or more organizations/agencies have rated a security, fund companies are to report the median rating, and in cases where there are more than two organization/agency ratings and a median rating does not exist, fund companies are to use the lower of the two middle ratings. PLEASE NOTE: Morningstar, Inc. is not itself an NRSRO nor does it issue a credit rating on the fund. An NRSRO or rating agency ratings can change from time-to-time. For credit quality, Morningstar combines the credit rating information provided by the fund companies with an average default rate calculation to come up with a weighted-average credit quality. The weighted-average credit quality is currently a letter that roughly corresponds to the scale used by a leading NRSRO. Bond funds are assigned a style box placement of “low”, “medium”, or “high” based on their average credit quality. Funds with a low credit quality are those whose weighted-average of the price/book ratios of all the stocks in a portfolio.

Variable Products: Are not a deposit of any Bank — Are not FDIC insured — Are not insured by Any Federal Government Agency — Are not guaranteed By Any Bank or Savings Association — May Go Down in Value
average credit quality is determined to be less than "BBB-"; medium are those less than "AA-"; but greater or equal to "BBB-"; and high are those with a weighted-average credit quality of "AA-" or higher. When classifying a bond portfolio, Morningstar first maps the NRSSO credit ratings of the underlying holdings to their respective default rates (as determined by Morningstar's analysis of actual historical default rates). Morningstar then averages these default rates to determine the average default rate for the entire bond fund. Finally, Morningstar maps this average default rate to its corresponding credit rating along a convex curve. For interest-rate sensitivity, Morningstar obtains from fund companies the average effective duration. Generally, Morningstar classifies a fixed-income fund's interest-rate sensitivity based on the effective duration of the Morningstar Core Bond Index (MCBI), which is currently three years. The classification of Limited will be assigned to those funds whose average effective duration is between 25% to 75% of MCBI's average effective duration; funds whose average effective duration is between 75% to 125% of the MCBI will be classified as Moderate; and those that are at 125% or greater of the average effective duration of the MCBI will be classified as Extensive. For municipal bond funds, Morningstar also obtains from fund companies the average effective duration. In these cases static breakpoints are utilized. These breakpoints are as follows: (i) Limited: 4.5 years or less; (ii) Moderate: more than 4.5 years but less than 7 years; and (iii) Extensive: more than 7 years. In addition, for non-US taxable and non-US domiciled fixed income funds static duration breakdowns are used: (i) Limited: less than or equal to 3.5 years; (ii) Moderate: greater than 3.5 and less than equal to 6 years; (iii) Extensive: greater than 6 years.

Credit Analysis
Ratings data provided to Morningstar reflect ratings assigned by one of the Nationally Recognized Statistical Rating Organizations (NRSSO). Bonds not rated by an NRSSO are included in the not rated (NR) category. Bonds with multiple ratings are classified according to the Barclays Capital Global Family of Indices ratings rules (i.e. Lowest rating used for bonds with two ratings. Middle rating used for bonds with more than two ratings.)

Average Effective Duration
Average effective duration is a measure of a fund's interest-rate sensitivity—the longer a fund's duration, the more sensitive the fund is to shifts in interest rates. Duration is determined by a formula that includes coupon rates and bond maturities. Small coupons tend to increase duration, while shorter maturities and a formula that includes coupon rates and bond maturities. Small

Average Effective Maturity
Average effective maturity is a weighted average of all the maturities of the bonds in a portfolio, computed by weighting each bond's effective maturity by the market value of the security. Average effective maturity takes into consideration all mortgage prepayments, puts, and adjustable coupons. Because Morningstar uses fund company calculations for this figure and because different companies use varying interest-rate assumptions in determining call likelihood and timing, we ask that companies not adjust for call provisions. Longer-maturity funds are generally considered more interest-rate sensitive than their shorter counterparts. Origin: Morningstar surveys fund companies for this data on a quarterly basis.

Average Weighted Price
Average Weighted Price is calculated from the fund's portfolio by weighing the price of each bond by its relative size in the portfolio. This number reveals if the fund favors bonds selling at prices above or below face value (discount or premium securities, respectively). A higher number indicates a bias toward premiums. This statistic is expressed as a percentage of par (face) value. Origin: Morningstar surveys fund companies for this data on a quarterly basis.

Asset Allocation Portfolios: Portfolios that seek to accomplish dual goals of income and capital appreciation by investing in a variety of securities in different asset classes. Many of these portfolios are structured as a "fund of funds" which is a portfolio that specializes in buying shares of other portfolios rather than individual securities. The "fund of funds" structure may have higher costs than if you invested directly in the underlying portfolios.

Credit Risk: Certain investments may involve credit risk. Credit risk is the risk that the issuer or the guarantor of a fixed income security, or the counterparty to a derivatives contract, repurchase agreement, loan of portfolio securities or other transaction, is unable or unwilling, or is perceived (whether by market participants, ratings agencies, pricing services or otherwise) as unable or unwilling, to make timely principal and/ or interest payments, or otherwise honor its obligations.

Derivatives Risk: Derivatives are subject to a number of risk such as leverage risk, liquidity risk, interest rate risk, market risk, credit risk and also involve the risk of mispricing or improper valuation. The Portfolio’s investments in derivatives may rise or fall more rapidly than other investments.

Foreign Securities Portfolios/Emerging Market Portfolios: The investor should note that portfolios that invest in foreign securities of these emerging markets may accentuate these risks.

Asset Allocation Portfolios: Portfolios that seek to accomplish dual goals of income and capital appreciation by investing in a variety of securities in different asset classes. Many of these portfolios are structured as a "fund of funds" which is a portfolio that specializes in buying shares of other portfolios rather than individual securities. The "fund of funds" structure may have higher costs than if you invested directly in the underlying portfolios.

Growth Portfolios: Investing in growth stocks is based upon a portfolio manager's subjective assessment of fundamentals or the companies he or she believes offer the potential for price appreciation. This style of investing involves risks and investors can lose money.

High-Yield Bond Portfolios: The investor should note that portfolios that invest in lower-rated debt securities (commonly referred to as junk bonds) involve additional risks because of the lower credit quality of the securities in the portfolio. The investor should be aware of the possible higher level of volatility, and increased risk of default.

Large Cap Portfolios: Investments in large-cap companies may involve the risk that larger more established companies may be unable to respond quickly to new competitive challenges such as changes in technology and consumer tastes.

Mid Cap Portfolios: The investor should note that portfolios that invest in companies with market capitalizations below $10 billion involve additional risks. The securities of these companies may be more volatile and less liquid than the securities of larger companies.

Money Market Portfolios: Money Market Portfolios are not insured or guaranteed by the Federal Deposit Insurance Corporation (FDIC).

Non-Diversified Portfolios: The investor should note that portfolios that invest more of their assets in a single issuer involve additional risks, including share price fluctuations, because of the increased concentration of investments.

Real Estate Portfolios: The investor should note that portfolios that invest in real estate involve risks such as refinancing, economic impact on industry, changes in property values and dependency on management skills.

Sector Portfolios: The investor should note that portfolios that invest exclusively in one sector or industry involve additional risks. The lack of industry diversification subjects the investor to increased industry-specific risks.

Small Cap Portfolios: The investor should note that portfolios that invest in stocks of small companies involve additional risks. Smaller companies typically have a higher risk of failure, and are not as well established as larger blue-chip companies. Historically, smaller-company portfolios have experienced a greater degree of market volatility than the overall market average.

Value Portfolios: Stock selection is based upon the portfolio manager's assessment of fundamentals of the companies that he/she believes to be undervalued. This style of investing may increase the volatility of the portfolio and may not produce the intended results over short or long time periods. Larger, more established companies may not be able to attain higher growth rates of smaller companies, especially during extended periods of economic expansion.

Variable annuities and variable life products are issued by AXA Equitable Life Insurance Company or MONY Life Insurance Company or MONY Life Insurance Company (NY, NY), MONY Life Insurance Company, AXA Equitable Life Insurance Company of America (MLOA) and are co-distributed through AXA Distributors, LLC and AXA Advisors, LLC. All companies are affiliated. These products have restrictions and limitations.
